

- **Terms**
 - KCL: KittyCAD Language, native zoo programming language for CAD
 - [Zoo CLI](#): command line interface to run KCL programs in terminal (as opposed to GUI)
 - [API](#): Application Programming Interface, lets diff software communicate w each other
 - They have a bunch that let you bridge diff tools w zoo
 - MCP server (Model Context Protocol server): connects generative AI apps to external tools and data sources. Allows AI models to access local files, databases, APIs, etc
 - opencode uses an MCP server, opencode itself is the MCP client
- **[KCL](#)**
 - <https://github.com/KittyCAD>
 - <https://zoo.dev/research/introducing-kcl>
 - Built into Zoo, or can use zoo extension to work in VSCode
 - KittyCAD API connects KCL with Zoo dev GUI
 - Zoo CLI for scripting with KCL and other zoo APIs? Good for integrating with GitHub actions (or other third party services)
 -  KCL Introduction: From zero to triangle
 -  KCL: Sketches, lines and curves
- **[Zookeeper](#)**
 - ML: machine learning, ML API bridge between ML model and diff apps
 - ML-Ephant ML API powers zookeeper
 - ML-Elephant API integrates ML and uses KittyCAD Design API to programmatically generate CAD files
 - Agentic AI system that generates KCL code to create CAD models in zoo
 - Basic agent: can use tools in a loop (eg plan > act > observe, replan > repeat)
 - Zookeeper powered by LLMs w strict context management (similar to others like claudecode, codex)
 - Has tools to write, execute, and debug KCL, as well as analyze 3D models via visual snapshots, and has computational tools for egr like mass calculation, surface area, volume, etc
 - Ask it to list its tools, they are being updated frequently
- **Tutorials**
 - [sketch mode](#)
 -
